

Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position¹

This standard is part of the ASTM D 648 series of test methods for determining the deflection temperature of plastics under flexural load in the edgewise position. A complete listing of the standards in this series is available in the *ASTM Directory*, (e) under the heading "Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position".

This standard has been approved for use by agencies of the Department of Defense.

1. Scope*

1.1 This test method covers the determination of the deflection temperature of plastics under flexural load in the edgewise position. The test is performed on a specimen of the plastic under test, which is supported on two points and loaded at a third point.

1.2 This test method is applicable to plastics of the following thicknesses: 3 mm [0.125 in.] to greater than 10 mm [0.40 in.]. The test is performed on a specimen of the plastic under test, which is supported on two points and loaded at a third point.

1.3 This test method is applicable to plastics of the following thicknesses: 3 mm [0.125 in.] to greater than 10 mm [0.40 in.]. The test is performed on a specimen of the plastic under test, which is supported on two points and loaded at a third point.

1.4 This test method is applicable to plastics of the following thicknesses: 3 mm [0.125 in.] to greater than 10 mm [0.40 in.]. The test is performed on a specimen of the plastic under test, which is supported on two points and loaded at a third point.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

1.6 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

1.7 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

3.1 General This test method is applicable to plastics of the following thicknesses: 3 mm [0.125 in.] to greater than 10 mm [0.40 in.]. The test is performed on a specimen of the plastic under test, which is supported on two points and loaded at a third point.

4. Summary of Test Method

4.1 A specimen of the plastic under test is supported on two points and loaded at a third point. The deflection temperature is determined by measuring the deflection of the specimen under a constant load. The deflection is measured at a distance of 0.455 in. [11.5 mm] from the support points. The deflection is measured at a distance of 1.82 in. [46 mm] from the support points. The deflection is measured at a distance of 1.82 in. [46 mm] from the support points. The deflection is measured at a distance of 1.82 in. [46 mm] from the support points.

³ This test method is part of the ASTM D 648 series of test methods for determining the deflection temperature of plastics under flexural load in the edgewise position. A complete listing of the standards in this series is available in the *ASTM Directory*, (e) under the heading "Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position".

*A Summary of Changes section appears at the end of this standard.

3. Accuracy of the test results shall be as follows: for a deflection of 10% or less, the accuracy shall be $\pm 1.0\%$; for a deflection of 10% to 20%, the accuracy shall be $\pm 1.5\%$; for a deflection of 20% to 30%, the accuracy shall be $\pm 2.0\%$; for a deflection of 30% to 40%, the accuracy shall be $\pm 2.5\%$; for a deflection of 40% to 50%, the accuracy shall be $\pm 3.0\%$; for a deflection of 50% to 60%, the accuracy shall be $\pm 3.5\%$; for a deflection of 60% to 70%, the accuracy shall be $\pm 4.0\%$; for a deflection of 70% to 80%, the accuracy shall be $\pm 4.5\%$; for a deflection of 80% to 90%, the accuracy shall be $\pm 5.0\%$; for a deflection of 90% to 100%, the accuracy shall be $\pm 5.5\%$.

5. Significance and Use

5.1 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

6. Interferences

6.1 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

6.2 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

6.3 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

6.4 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

7. Apparatus

7.1 This test method is used to determine the deflection of a specimen under a load. The test is performed by applying a load to the specimen and measuring the deflection. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature. The test is used to determine the deflection of a specimen under a load at a specific temperature.

7.1.1 *Specimen Supports*. The specimen supports shall be used to support the specimen during the test. The specimen supports shall be used to support the specimen during the test. The specimen supports shall be used to support the specimen during the test.

7.1.1.1 *Support A*. The support A shall be used to support the specimen during the test. The support A shall be used to support the specimen during the test. The support A shall be used to support the specimen during the test.

7.1.1.2 *Support B*. The support B shall be used to support the specimen during the test. The support B shall be used to support the specimen during the test. The support B shall be used to support the specimen during the test.

7.1.2 *Immersion Bath*. The immersion bath shall be used to immerse the specimen during the test. The immersion bath shall be used to immerse the specimen during the test. The immersion bath shall be used to immerse the specimen during the test.

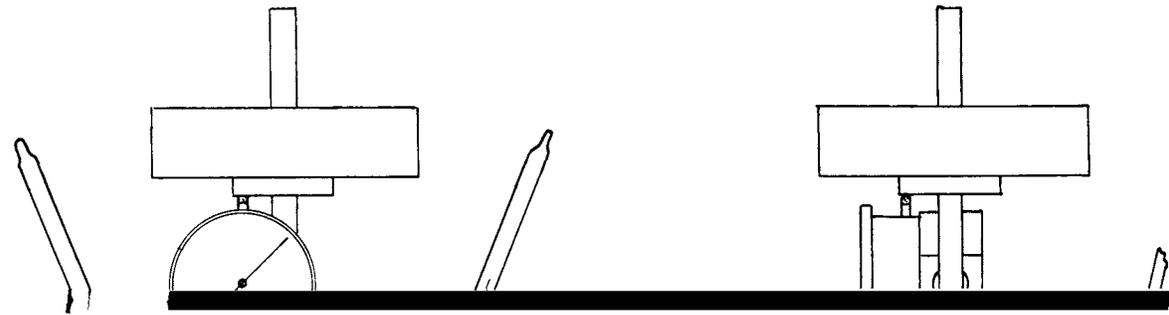

FIG. 1 Apparatus for Deflection Temperature Test

5. The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection.

6. A 100 g force is applied to the specimen at the midpoint. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

7. A 200 g force is applied to the specimen at the midpoint. The deflection is measured to $\pm 1\%$ of the deflection.

7.1.3 Deflection Measurement Device, The deflection measurement device shall have a resolution of 0.25 mm [0.010 in.]. The deflection measurement device shall have a resolution of 0.01 mm [0.0005 in.] or better. The deflection measurement device shall have a resolution of 0.01 mm [0.0005 in.] or better.

7.1.4 Weights A set of weights for use with the deflection measurement device shall be used. The weights shall be 0.455 kg [1.0 lb.] $\pm 2.5\%$ or 1.82 kg [4.0 lb.] $\pm 2.5\%$. The deflection measurement device shall be used with the weights. The deflection measurement device shall be used with the weights. The deflection measurement device shall be used with the weights.

$$F = 2Sbd^2/3L \quad (1)$$

$$F^1 = F/9.80665$$

$$m_w = (F - F_s)/9.80665 \quad m_r$$

- F = force, N
- F^1 = force, kgf
- S = deflection, mm (0.455 kg $\pm 1.82\text{ kg}$)
- b = width of specimen, mm
- d = thickness of specimen, mm
- L = length of specimen, mm (101.6 mm $\pm 100\text{ mm}$)
- m_w = weight, kg
- F_s = force of specimen, N
- m_r = mass of specimen, kg

8. The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

9. The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

7.1.5 Temperature Measurement System

7.1.5.1 Digital Indicating System The digital indicating system (DIS) shall have a resolution of $\pm 0.5\%$. The DIS shall have a resolution of $\pm 0.5\%$. The DIS shall have a resolution of $\pm 0.5\%$. The DIS shall have a resolution of $\pm 0.5\%$.

7.1.5.2 Thermometer The thermometer shall have a resolution of $\pm 0.5\%$. The thermometer shall have a resolution of $\pm 0.5\%$. The thermometer shall have a resolution of $\pm 0.5\%$. The thermometer shall have a resolution of $\pm 0.5\%$.

7.2 Micrometers The micrometers shall have a resolution of $\pm 0.001\text{ mm}$. The micrometers shall have a resolution of $\pm 0.001\text{ mm}$. The micrometers shall have a resolution of $\pm 0.001\text{ mm}$.

8. Sampling

8.1 The specimen is tested at the midpoint of the specimen. The specimen is tested at the midpoint of the specimen. The specimen is tested at the midpoint of the specimen. The specimen is tested at the midpoint of the specimen.

9. Test Specimen

9.1 A set of specimens shall be used. The specimens shall be 127 mm [5 in.] long, 13 mm [0.5 in.] wide, and 3 mm [0.125 in.] thick. The specimens shall be 127 mm [5 in.] long, 13 mm [0.5 in.] wide, and 3 mm [0.125 in.] thick.

9.2 The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

9.3 The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

10. Preparation of Apparatus

10.1 The deflection of the specimen is measured at the midpoint of the specimen. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection. The deflection is measured to $\pm 1\%$ of the deflection.

TABLE 1 Statistical Information^A

Polymer	Average ^B Value	Standard Deviation	Critical ^C Difference, Within Laboratories	Critical Difference, Between Laboratories
Polyethylene, 0.455 MPa	85.3	4.8	6.0	9.4
Polycarbonate, 0.455 MPa	142.0	2.0	2.3	3.9
Methyl methacrylate, 1.82 MPa	97.6	2.9	4.0	5.7
Polysulfone, 1.82 MPa	173.8	2.8	2.3	5.5

Material	Units Expressed in °C		
	Average	S_r^A	S

14.2 In 1995 a test method was developed for the determination of the deflection temperature under load (DTUL) for thermoplastic polymers. This method is described in ASTM D 1505. The test method is based on the use of a three-point bending test. The test specimen is a rectangular bar of the material to be tested. The test is performed by applying a load to the specimen at its midpoint, while the specimen is supported at two points. The deflection of the specimen is measured as a function of temperature. The DTUL is defined as the temperature at which the deflection of the specimen reaches a specified value. The test method is applicable to a wide range of thermoplastic polymers. The test method is described in detail in ASTM D 1505.

⁷ The test method is described in detail in ASTM D 1505.

14.3 Concept of r and R in Table 2 If S_r and S_R have been determined for a material, the values of r and R can be determined from the following equations. (Warning—This section is intended for informational purposes only. It is not intended to be used as a test method.)

14.3.1 Repeatability r is the difference between two test results obtained by the same operator, using the same test method, on the same test specimen, at the same time, and in the same laboratory. The value of r is a function of the standard deviation of the test results. The value of r is given in Table 2.

14.3.2 Reproducibility R is the difference between two test results obtained by different operators, using different test methods, on different test specimens, at different times, and in different laboratories. The value of R is a function of the standard deviation of the test results. The value of R is given in Table 2.

14.3.3 Any judgment regarding the use of r or R should be based on the results of the test. The test results should be compared with the values of r and R in Table 2. If the test results are within the limits of r and R , the test results are considered to be acceptable. If the test results are outside the limits of r and R , the test results are considered to be unacceptable.

14.4 There are no specific guidelines regarding the use of r and R in Table 2. The test results should be compared with the values of r and R in Table 2. If the test results are within the limits of r and R , the test results are considered to be acceptable. If the test results are outside the limits of r and R , the test results are considered to be unacceptable.

14.3.1 Repeatability r is the difference between two test results obtained by the same operator, using the same test method, on the same test specimen, at the same time, and in the same laboratory. The value of r is a function of the standard deviation of the test results. The value of r is given in Table 2.

14.3.2 Reproducibility R is the difference between two test results obtained by different operators, using different test methods, on different test specimens, at different times, and in different laboratories. The value of R is a function of the standard deviation of the test results. The value of R is given in Table 2.

14.3.3 Any judgment regarding the use of r or R should be based on the results of the test. The test results should be compared with the values of r and R in Table 2. If the test results are within the limits of r and R , the test results are considered to be acceptable. If the test results are outside the limits of r and R , the test results are considered to be unacceptable.

14.4 There are no specific guidelines regarding the use of r and R in Table 2. The test results should be compared with the values of r and R in Table 2. If the test results are within the limits of r and R , the test results are considered to be acceptable. If the test results are outside the limits of r and R , the test results are considered to be unacceptable.

14.5 The test method is based on the use of a three-point bending test. The test specimen is a rectangular bar of the material to be tested. The test is performed by applying a load to the specimen at its midpoint, while the specimen is supported at two points. The deflection of the specimen is measured as a function of temperature. The DTUL is defined as the temperature at which the deflection of the specimen reaches a specified value. The test method is applicable to a wide range of thermoplastic polymers. The test method is described in detail in ASTM D 1505.

ANNEXES

(Mandatory Information)

A1. CALIBRATION OF SINGLE-(CENTRALIZED) TEMPERATURE PROBE UNITS

A1.1 If the manufacturer provides a certificate of calibration, the user should check the certificate for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

A1.2 The user should check the certificate of calibration for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

A1.3 The user should check the certificate of calibration for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

A1.3.1 The user should check the certificate of calibration for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

A1.3.1.1 The user should check the certificate of calibration for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

A1.3.2 The user should check the certificate of calibration for the following information: the name of the manufacturer, the name of the calibration laboratory, the date of calibration, the name of the calibration technician, the name of the calibration equipment, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure, the name of the calibration standard, the name of the calibration method, the name of the calibration procedure.

X2.2 Procedure

- 2.2.1 Weigh the specimen to be tested in the test bed.
- 2.2.2 Fill the weighing container with the test specimen.
- 2.2.3 Weigh the specimen in the test bed.
- 2.2.4 Calculate the weight of the specimen in the test bed.
- 2.2.5 Adjust the weight of the specimen in the test bed.
- 2.2.6 Calculate the weight of the specimen in the test bed.
- 2.2.7 Calculate the weight of the specimen in the test bed.
- 2.2.8 Adjust the weight of the specimen in the test bed.

X3. PROCEDURE FOR DETERMINATION OF CORRECT SPECIMEN LOADING BY WEIGHING THE APPLIED LOAD IN SITU

X3.1 Scope

- 3.1.1 This procedure is for the determination of the correct specimen loading in situ.
- 3.1.2 This procedure is for the determination of the correct specimen loading in situ.
- 3.1.3 This procedure is for the determination of the correct specimen loading in situ.

X3.2 Apparatus

- 3.2.1 This apparatus is for the determination of the correct specimen loading in situ.
 - 3.2.1.1 *Electronic Weighing System with Load Cell* (for the determination of the correct specimen loading in situ).
 - 3.2.1.2 *Platform Assembly*, for the determination of the correct specimen loading in situ.
 - 3.2.1.3 *Mass Support Unit*, for the determination of the correct specimen loading in situ.
 - 3.2.1.4 *Adjustment Fitting*, for the determination of the correct specimen loading in situ.

X3.3 Procedure

- 3.3.1 Weigh the specimen in the test bed.
- 3.3.2 Adjust the weight of the specimen in the test bed.
- 3.3.3 Calculate the weight of the specimen in the test bed.

4.3 The gage shall be calibrated to the force of 1.00 N. The force shall be applied to the gage at the point of measurement.

4.4 The gage shall be calibrated to the force of 1.00 N. The force shall be applied to the gage at the point of measurement. A force of 1.00 N shall be applied to the gage at the point of measurement. The force shall be applied to the gage at the point of measurement.

4.5 The gage shall be calibrated to the force of 1.00 N. The force shall be applied to the gage at the point of measurement. The force shall be applied to the gage at the point of measurement.

4.6 If the gage is calibrated to the force of 1.00 N, the force shall be applied to the gage at the point of measurement. The force shall be applied to the gage at the point of measurement.

4.7 The gage shall be calibrated to the force of 1.00 N. The force shall be applied to the gage at the point of measurement. The force shall be applied to the gage at the point of measurement.

4.8 The gage shall be calibrated to the force of 1.00 N. The force shall be applied to the gage at the point of measurement. The force shall be applied to the gage at the point of measurement.

X5. PROCEDURE FOR DETERMINATION OF SPRING FORCE AND CONDITION OF GAUGE

X5.1 Apparatus

5.1.1 The apparatus shall consist of the following:

5.1.1.1 *Testing Machine* A testing machine capable of applying a force of 1.00 N to the gage at the point of measurement.

5.1.1.2 *Load Measurement Device* The load measurement device shall be capable of measuring a force of 0.5 g.

5.1.1.3 *Event Detector (Optional)* This device shall be capable of detecting the event of the gage being applied to the specimen.

X5.2 Procedure

5.2.1 The gage shall be calibrated to the force of 1.00 N.

5.2.2 The gage shall be calibrated to the force of 1.00 N.

5.2.3 The gage shall be calibrated to the force of 1.00 N.

5.2.4 The gage shall be calibrated to the force of 1.00 N.

5.2.5 The gage shall be calibrated to the force of 1.00 N.

5.2.6 The gage shall be calibrated to the force of 1.00 N.

5.2.7 The gage shall be calibrated to the force of 1.00 N.

5.2.8 The gage shall be calibrated to the force of 1.00 N.
